```
During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORWPEP database can be found at http://www.sanger.ac.uk/Projects/C elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 9, constructed by the Sanger Centre Chromosome 9 Mapping Group. Further information can be found at http://www.sanger.ac.uk/HGPChry

RP11-196118 is from the library RPCI-11.1 constructed by the group of Pieter de Jong. For further details see http://www.chori.org/bacpac/home.htm

VECTOR: PBACG3.6

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       NOTE: This is a 'working draft' sequence. It currently consists of 26 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as arbitrary of but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

granulocyte colony stimulating factor (G-CSF) expression for gene therapy and treatment of G-CSF associated disorders e.g. the side effects of Gene encoding an antigen recognizing an antibody which induces

Claim 1; Page 47-49; 58pp; Japanese.

The present invention relates to a gene encoding an antigenic protein recognised by an antibody or its fragments which can induce the production of granulocyte colony stimulating factor (G-CSF). Also included in the invention are partial sequences of the gene, antibodies recognising all or part of the antigenic protein, expression vectors containing the gene and host cells transformed by the vector. The gene used for gene therapy, and compounds identified by screening using the gene sequence are used for treatment and prevention of disorders associated with G-CSF expression such as the side effects of cancer

The cartilage differentiation etimulator can be used in diagnosis, prevention and treatment of cartilage and bone metabolism diseases. They can also be used for diagnosing biophylaxis, cell differentiation, cell growth and construction of extracellular matrix related diseases. MTf-BP strongly stimulates differentiation of eartilage cells and exhibits similar action mechanism with that of plant derived ConA. This sequence represents a cartilage cell differentiation stimulator associated polypeptide described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   240

The invention relates to a mouse or human gene (MMR19) encoding a protein which bindes to antibodies or their fragments which induce granulocytecolony stimulating factor (G-CSF) secretion. The genes and proteins of the invention are used in diagnosis, treatment and prevention of diseases associated with G-CSF, including infections and neutrophil deficiency disease. This sequence represents a cDNA encoding a mouse G-CSF-inducible antibody binding protein, MMR19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                TTTTCATGATGCTTATACCATGAGAGGAGCTGGCGCAGTGGATTCATACCCACTCTAAAG

The present sequence encodes a human enzyme. The enzyme polynucleotide and polypeptide are useful for diagnosis, treatment and prevention of cancers, neutrological disorders (e.g. epilepsy, stroke, Alzheimer's disease, plok's disease, thuntington's disease, dementia, multiple sclerosis, Parkinson's disease, amyotropic lateral sclerosis, bacterial and britzal meningitis, schizophrenic disorders and neuroskeletal and sorders), autoimmune/inflammatory disorders and neuroskeletal disorders, autoimmune disease, atopic dermatitis, diabetes mellitus, anemia, asthma, Crohn's disease, atopic dermatitis, diabetes mellitus, ceteoporosis, paracitis, psoriasis, rheumatoid arthritis, and viral, bacterial, fungal, parasitic, processal and helminthic infections), ceteoporosis, processal and helminthic infections), genetic disorder (e.g. Duchenne and Becker muscular dystrophy, Gaucher's disease, Huntington's chorea, sickle cell anemia, thalassemia, Voncher Millebrand's disease and Wilms' tumour), and cell proliferative disorder (e.g. atherosclerosis, leukemia, hepatitis, cirrhosis, and

DNA encoding antigen recognised by Ab capable of inducing G-CSF activity

```
The present invention relates to a gene encoding an antigenic protein recognised by an antibody or its fragments which can induce the production of granulocyte colony stimulating factor (G-CSF). Also included in the invention are partial sequences of the gene, antibodies recognising all or part of the antigenic protein, expression vectors containing the gene and host cells transformed by the vector. The gene used for gene therapy, and compounds identified by screening using the gene sequence are used for treatment and prevention of disorders associated with G-CSF expression such as the side effects of cancer therapy (including bone marrow suppression). The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       361 CTGCTGTGATGGCTACCCTTCTGTTTCCAGGACAGGAGTTTAAAATTACACATCAAGAGA 420

```
which binds to antibodies or their fragments which induce granulocytecolony stimulating factor (G-GSP) secretion. The genes and proteins of the invention are used in diagnosis, treament and prevention of diseases associated with G-CSF, including infections and neutrophil deficiency disease. This sequence represents a cDNA encoding a human G-CSF-inducible
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    GAATTGTGTAAGCCAAGTGGATGCCTAAGCATCTCCAACAATAAAAC-AAACTCAATTAT 779

containing an expression system computising the HFIZG53 nucleic acid are containing an expression system comprising the HFIZG53 nucleic acid are useful for diagnosing diseases related to over or underexpression of HFIZG53 protein. HFIZG53 polypeptides can be used to screen for agonists and antagonists which can be used to screen for agonists and antagonists which can be used in treatment to activate or inhibit HFIZG53 activity. Gene therapy may also be used to activate or inhibit HFIZG53 activity. Gene therapy may also be used to activate or inhibit HFIZG53 activity. Gene therapy may also be used to activate or inhibit HFIZG53 activity of the polypeptide by affinity chromatography. CC and retroviral vectors. HFIZG53 antibodises are useful for inducing an immune response to immunise and prevent diseases, and for isolatings. HFIZG53 polypeptides can be administered directly or as a vaccine to incoulate against disease. Diseases prevented, diagnosed or treated include inflammatory diseases such as Adult Respiratory Disease Syndrome. The manacoid arthritis, ottecarthritis, inflammatory Disease Syndrome, psoriasis, dermatitis, allergies; infections including bacterial, fungal, psoriasis, dermatitis, an lergies; infections including bacterial, fungal, concluding testicular cancer; anorexia; bulimia; Parkinson's disease; and other immunodeficiency disorders; septic shock; injury; pain; cardiovascular disease including restencionis, appertension; urinary cardiovascular disease including restencionis, protectoris; ulcers; benign prostatic hypertrophy; and cardiovascular diseases including restencionis, septic chock; induction; definitum, everee mental retardation) and dyskinesias, and manic depression, dementia, severe mental retardation) and dyskinesias, such as Huntington's diseases or Gilles de a Tourette's syndrome. The HFIZG53 polypeptide is also useful for mapping the gene to a chromosome.
                                                                                                                                                                                                                       HIV-associated cachexia; immunodeficiency disorder; septic shock; pain;
Parkinson's disease; cardiovascular disease; psychotic; neurological;
Huntington's disease; Gilles de la Tourette's syndrome; gene mapping;

The invention describes a cartilage cell differentiation stimulator (containing a membrane-bound transferrin-like protein (WTf-BP) and a membrane bound type transferrin-like protein (WTf-BP) and an animal-derived concanavalin-like drug. The cartilage differentiation at mimal-derived used in diagnosis, prevention and treatment of cartilage and bone metabolism diseases. They can also be used for diagnosing biophylaxis, cell differentiation, cell growth and construction of extracellular matrix related diseases. MTf-BP strongly stimulates differentiation of cartilage cells and exhibits similar action mechanism with that of plant derived ConA. This sequence represents a cartilage cell differentiation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 7

                                                                                                                                                                                                                                                                              The present invention describes a method for determining whether a compound induces a toxic effect on a tissue or cell. The method comprises the preparing a gene expression profile of a tissue or cell sample exposed to the compound, and comparing the gene expression profile to a database comprising and a comparing the gene expression profile to a database comprising data or information on the Tox mean and non-Tox mean value. The method is useful for predicting or identifying at least one toxic effect, particularly hepatocoxicity, of a test or unknown compound. The genes listed in the specification are useful as diagnostic or toxicity markers for the prediction or identification of the physiological state of tissue or cell sample that has been exposed to a compound, or to identify or predict the toxic effects of a compound or an agent. These may also be used as markers for monitoring toxicity progression or for drug screening. The present sequence represents a primary rat hepatocyte toxicity modelling related gene sequence from the present invention.

diagnosing pre-pathologic disorders, and chronic or acute diseases associated with abnormalities in the expression, amount or distribution of the protein. The present sequence represents a cDNA of the invention that is differentially expressed in activated vascular tissue. Note: The sequence data for this patent did not form part of the specification, but was obtained in electronic format directly from USPTO at http.seqdata.uspto.gov/sequence.html?DocID=20020137081

RESULT 11 AAZ16856

This invention relates to a combination comprising several CDNAs that are discloses a high throughput method for detecting differentially expressed in activated vascular tissue. The invention also discloses a high throughput method for detecting differentially expressed cDNAs in a sample. The CDNAs of the invention may have antiatreriosclerotic; cytostatic; cardiant; hypotenaive; antidiabetic; cytostatic; cardiant; hypotenaive; antidiabetic; cytostatic; cardiant; hypotenaive; antidiabetic; companies of secretive activities and may be used in gene therapy. The CDNAs of the invention may be used in a high-compound that specifically binds a CDNA of the invention. A protein encoded by the CDNA may be used to screen several contenties or compounds to identify a nationally binds at CDNA of the invention, or to produce or purify an antibody to the protein that can be used to detect a protein in a sample or purify a natural or compounds to detect a protein in a sample or purify an autical or content content content that can be used to detect a protein in a sample. The nucleotides may be useful for content disease, e.g. atherosclerosis, cancer, coronary artery disease, hypertension, or stroke. The cDNAs can also be used for large-scale conjugated to genetic or gene expression analysis of several new nucleic acid contents or stroke. The cDNAs can also be used for large-scale configured contents. Antibodies to the proteins encoded by the cDNAs are useful for

The present invention describes a library of human polymucleotides comprising the sequences given in AAZ12532 to AAZ1779. Also described is a method of detecting differentially expressed genes correlated with the cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample from a cell suspected of being cancerous, where the gene product is encoded by one of the 5248 polymucleotide sequences given in AAZ1732 to AAZ1779. The polymucleotides can be used as a source of primers and probes, which can be used for a variety of purpose, e.g. detection of expression levels, mapping, tissue typing or profiling, forensics, genetic analysis and detection of polymorphisms. Polymeptides encoded by the polymucleotides can be used for raising antibodies for experimental, diagnostic and therapeutic purposes. The polymucleotides may also be used to construct arrays for diagnostics (which may be used to determine function of an encoded protein); and to detect differences in expression levels between two cells (e.g. to identify abnormal or diseased tissue in a human, to two cells, prognosis and management of colorectal cancer, breast cancer, and lung cancer. The polymucleotides of the invention are especially used in the day of the invention are sepecially used in the and lung cancer. The polymucleotides can also be used to screen for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel human genes and their expression products which are differentially expressed in different cell types.

comprising the sequences given in AZ212532 to AZ21779. Also described is method of detecting differentially expressed genes correlated with the cancerous state of a mammalian cell, comprising detecting at least one differentially expressed genes correlated with the cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample from a cell suspected of being cancerous, where the gene product is encoded by one of the 5248 polymucleotide sequences given in AAZ12532 to AAZ1779. The complexity of purpose, e.g. detection of expression levels, mapping, tissue typing or profiling, forensics, genetic analysis and detection of polymorphisms. Polymeptides encoded by the polymucleotides can be used for raising antibodies for experimental, diagnostic and therapeutic purposes. The polymucleotides may also be used to construct corresponding for diagnostics which may be used to determine function of an encoded protein); and to detect differences in expression levels between two cells (e.g. to identify abnormal or diseased tissue in a human, to conserv: The polymucleotides of the invention are especially used in the diagnosis, prognosis and management of colorectal cancer, breast cancer, and lung cancer. The polymucleotides can also be used to screen for construct constitutes.
                                                Novel human genes and their expression products which are differentially expressed in different cell types.
                                                                                                                                                                                           present invention describes a library of human polynucleotides
                                                                                                                                        Claim 1; Page 2200; 2479pp; English

```

The present invention describes a library of human polynucleotides comprising the sequences given in AA21233 to AA21779. Also described is a method of detecting differentially expressed genes correlated with the cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product is a encoded by one of suspected of being cancerous, where the gene product is encoded by one of the 5248 polynucleotide sequences given in AA21233 to AA21779. The polynucleotides can be used as a source of primers and probes, which can be used for a variety of purpose, e.g. detection of expression levels, mapping, tissue typing or profiling, forensics, genetic analysis and detection of polymorphisms. Polypeptides encoded by the polymucleotides can be used for raising antibodies for experimental, diagnostic and therapeutic purposes. The polymucleotides may also be used to construct arrays for diagnostics (which may be used to determine function of an encoded protein); and to detect differences in expression levels between two cells (e.g. to identify abnormal or diseased tissue in a human, to identify a genetic predisposition or susceptibility to a disease such as cancer, The polymucleotides can also be used to screen for and lung cancer. The polymucleotides can also be used to screen for Claim 1; Page 1511; 2479pp; English peptide analogues and antagonists

Novel human genes and their expression products which are differentially expressed in different cell types.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 TITICATGAATGCTTATACCATGAGAGGAGCTGGCGCAGTGGATTCATACCCACTCTAAAG 360
ABD17575 to ABD20506 represent isolated polynucleotide (I) sequences, and ABP5446 to ABP54472 represent protein (II) sequences, from the present invention. (I) and (II) have cytostatic activity and can be used in gene present and vand vaccines. (I), (II), antibodies and compositions from the present invention are useful for diagnosing, preventing and treating cancer, which expresses CT or CP mRNA antigens. They are useful for stimulating immune response. They can also be useful in virology, immunology microbiology, molecular biology and recombinant DNA techniques. N.B. The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from NIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   180

New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell Adams M, interactions Venter JC,

18

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL6176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB5737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences Claim 1; SEQ ID NO 3484; 21pp + Sequence Listing; English
